

# [Content for presentation slides - summarized]

## Slide Deck Structure

### Slide 1: Title

- DevOps Migration Assessment
- From Jenkins/Bamboo/GitLab to Azure DevOps

### Slide 2: Executive Summary

- Migration scope and objectives
- Key accomplishments

### Slide 3: Current State

- On-prem toolchain overview
- Challenges and pain points

### Slide 4: Target Architecture

- Azure DevOps Services
- Azure Container Apps
- Jira Cloud integration

### Slide 5: Migration Approach

- Phased migration strategy
- Migration factory pattern
- Reusable templates

### Slide 6: Application Containerization

- Multi-stage Dockerfile
- Docker Compose setup
- Health checks and monitoring

### Slide 7: Infrastructure as Code

- Bicep/Terraform templates
- Key resources provisioned
- Environment repeatability

### Slide 8: CI/CD Pipeline

- Azure DevOps YAML pipeline
- Reusable templates
- Self-hosted agent setup
- Security scanning

### Slide 9: Security & Governance

- Key Vault integration
- OIDC authentication
- Environment approvals
- Audit logging

### Slide 10: Jira Cloud Migration

- Migration readiness assessment
- Wave planning
- Integration with ADO

### Slide 11: Rollback Strategy

- Container App revision rollback
- Database restoration
- Pipeline rollback

### Slide 12: Monitoring & Observability

- Application Insights
- Log Analytics
- Metrics and alerts

### Slide 13: Hypercare Plan

- 24/7 monitoring
- Incident response
- Knowledge transfer

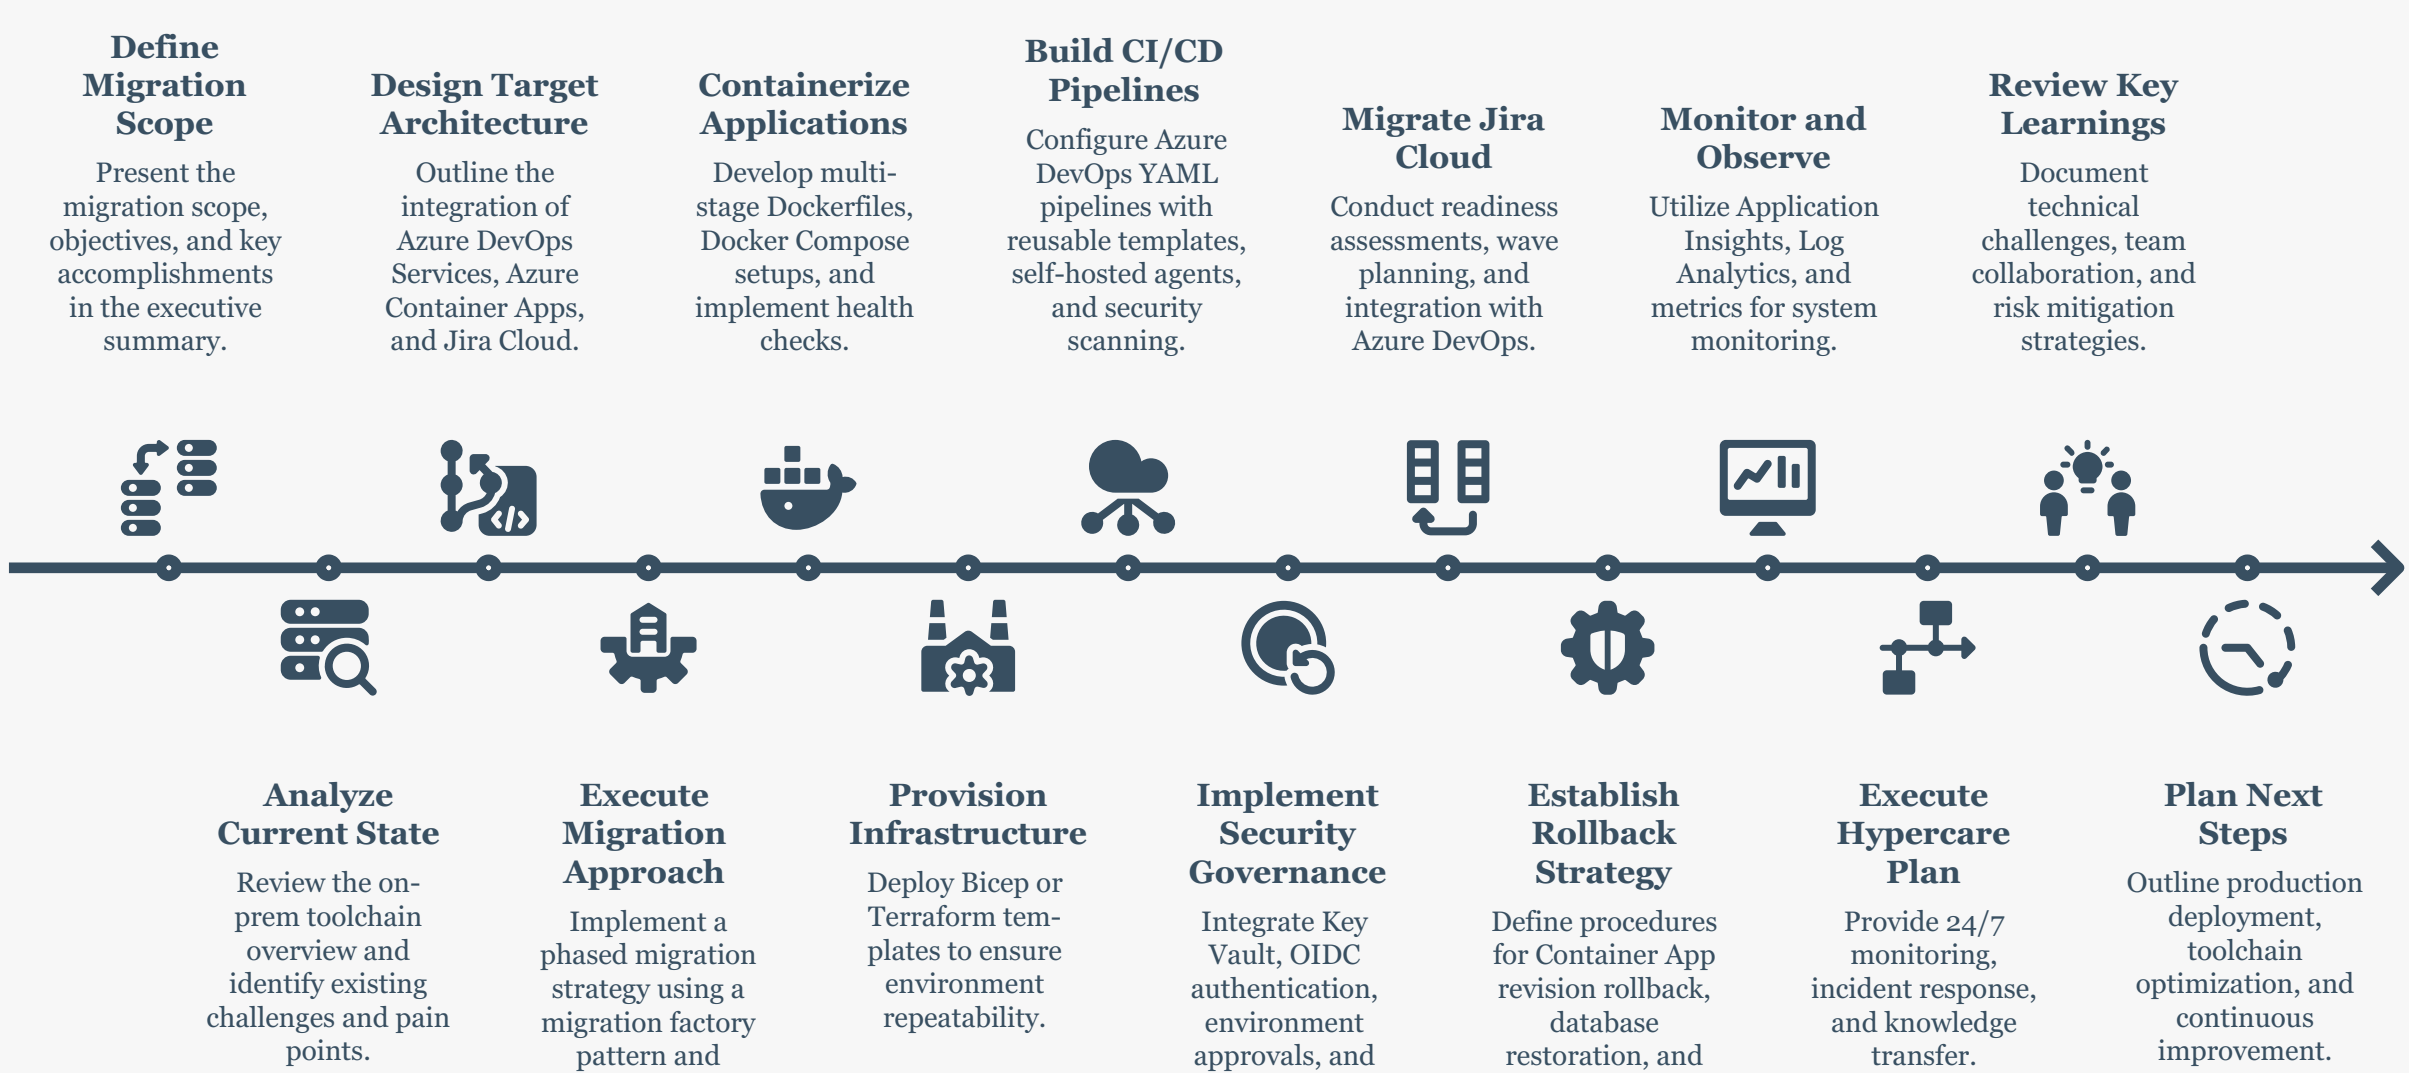

### Slide 14: Key Learnings

- Technical challenges
- Team collaboration
- Risk mitigation

### Slide 15: Next Steps

- Production deployment
- Toolchain optimization
- Continuous improvement

## DevOps Migration Assessment Structure

Made with Napkin

## Repository Creation and Submission

### Step 1: Create the Repository Structure

```
# Create all directories
mkdir -p candidate-repo/{apps,container,pipelines/{templates,github-actions,legacy-migration},legacy-ci/{jenkins,bamboo,gitlab},self-hosted-agent,iac/{bicep,terraform},k8s,tools,reports,docs}

# Create README.md
cat > candidate-repo/README.md << 'EOF'
# DevOps Migration Assessment

## Overview
This repository contains the complete implementation for migrating a Spring PetClinic monolith from on-prem Jenkins/Bamboo/GitLab to Azure DevOps Services and Jira Cloud.

## Structure
- `/apps` - Application source code (cloned from GitHub)
- `/container` - Dockerfiles and compose configurations
- `/pipelines` - Azure DevOps and GitHub Actions pipelines
- `/iac` - Infrastructure as Code (Bicep/Terraform)
- `/k8s` - Kubernetes manifests
- `/tools` - Migration analysis scripts
- `/docs` - Architecture and runbook documentation

## Quick Start
1. Clone repositories
2. Setup Azure infrastructure
3. Configure self-hosted agent
4. Run Azure DevOps pipeline
5. Validate deployment

## Prerequisites
- Azure subscription
- Azure DevOps organization
- GitHub account
- Local Docker environment
EOF
```

## Repository Creation and Submission Process
